(54) Title: ELECTRONIC ARRANGEMENT FOR AN ELECTRIC COMPONENT AND AS A SUPPORT FOR SENSORS

(54) Bezeichnung: ELEKTRODENANORDNUNG FÜR EIN ELEKTRISCHES BAUELEMENT UND ALS TRÄGER FÜR SENSOREN

(57) Abstract

The invention relates to an electrode arrangement for an electronic component, also acting as a support for sensors. Said electrode arrangement is mounted on a substrate (1) as a suitably dimensioned surface—structure of two electro—conductive electrodes which are not electrically connected to one another. The electrode arrangement reproduces the conductivities and/or the substance of a sensor—active layer on the conductance of a measuring head or a functional element when said conductivities of the electrode arrangement and/or substance of a sensor—active layer are reproduced in a highly flexible manner. Said electrode arrangement can be produced in a simple and cost—effective manner. The invention provides for a plurality of conductive islands (3) which are not linked or not essentially linked to one another and which are mounted on a dielectric substrate (1) between two electrodes (2) in the form of a planar two—dimensional arrangement.
